Project Title: FoodLens- AI-Powered Ingredient Scanner and Health Risk Scoring System

Project Description

FoodLens is an AI-powered mobile application that scans a packaged food product's barcode or ingredient label and generates a personalized health risk score, using barcode lookup (Open Food Facts) and OCR/NLP for regional products missing from global databases, a rule-based scoring engine weighted by ingredient risk and personalized to the user's health conditions and allergies, and an AI layer that only phrases pre-verified results into plain-language explanations rather than making health claims itself — further extended with product comparison, consumption tracking and reporting, a community-sourced product database for regional coverage, sharing, admin analytics.
